

SS1 - Representation, analysis and control for dynamic systems

OBJECTIVES	CONTENTS
<p>This course is an introduction to automatic control and it aims at providing the non-specialized students the basics of the servo systems theory and above all their implementation through a concrete example according to realistic specifications.</p> <p>The aims of the module are the following:</p> <ul style="list-style-type: none"> ○ Deriving transfer function and state space representation of a linear dynamic system starting from a set of differential equation; ○ Describing the performance of a linear system both in time and frequency domain; ○ Solving a practical control problem in terms of tracking and/or rejection performance with an appropriate controller; ○ To understand the technological limits due to real time implementation of a discrete controller. <p>Pre-requisites:</p> <ul style="list-style-type: none"> ○ Engineering maths <p>Organization 30x lectures (30h) 15x tutorials (15h) including an experimental lab session (5h)</p> <p>Total: 45 hours (excluding examination, revision time, and personal work)</p> <p>Estimated personal work (including revision time): 65 hours</p> <p>Evaluation Lab session (20%) 1 intermediate written exam (1h) (20%) 1 final written exam (2h) (60%)</p> <p>US CREDIT HOURS / ECTS : 3 / 6</p>	<p>CONTENTS</p> <p>Introduction</p> <ul style="list-style-type: none"> ○ The concept of dynamical systems. ○ Laplace Transform ○ Transfer function. - State space representation <p>Frequency and Time Domain Response</p> <ul style="list-style-type: none"> ○ Bode, Black, Nyquist ○ 1st and 2nd order systems ○ Introduction to Matlab (CAD) <p>Stability Analyse</p> <ul style="list-style-type: none"> ○ Root Locus ○ Nyquist and Bode stability Criteria ○ Precision of linear systems <p>Controllers</p> <ul style="list-style-type: none"> ○ Frequential Design ○ Modal control ○ Practical Tuning and implementation of a PID controller ○ Introduction to Robustness <p>Case study</p> <ul style="list-style-type: none"> ○ Presentation of the case study. ○ System modelling ○ Analysis of requirements specification ○ Design control ○ Real-time control implementation <p>Bibliography :</p> <p>Gene F. Franklin, J. David Powell, Abbas Emami-Naeini, Feedback Control of Dynamic Systems, Pearson ed, 7th edition</p> <p>Course directors: Yves Briere</p> <p>ISAE-SUPAERO contact: Yves Briere</p>

SS2 - Introduction to Aircraft Structures

OBJECTIVES

This course is an introduction to the preliminary design of aircraft structures. It is mainly focused on the basic concerns required before pre-sizing aircraft structures. The general architecture of aircraft structures is described to justify the interest in the use of the Beam Theory. The Beam Theory is then reminded then focused on the thin walled sections and hyperstaticity. It is then applied to analysis of load transfer within joints. A particular emphasis on the stress analysis on thin walled structure is offered through the presentation of an industrial case. Finally, a fundamental opening on Fatigue and Damage Tolerance (F&DT) applied to aircraft structures is offered from an industrial point of view.

The aims of the module are the following:

- To be able to explain the main problems to be considered when pre-sizing aircraft structures
- To be able to explain how aircraft structures are designed
- To be able to explain how thin walled structures are loaded
- To be able to compute the induced loads in thin-walled structures
- To be able to explain the stakes linked to F&DT
- To be able to perform elementary F&DT analyses

Pre-requisites:

- Fundamentals of continuum mechanics
- Fundamentals of Solid Mechanics
- Basic of Beam Theory

Organization

24x lectures including tutorials and project kick off (24x1h = 24h)

2x workshops (2x2h = 4h)

2x student projects (2x(0.5+0.5)h=2h for intermediate review and final defense)

Total: 30 hours (excluding written examination, revision time, work on project and personal work)

Evaluation

30% : 1 written exam (2h)

25%+25% : 1 oral defense for each of both projects (2x0.5h)

10%+10% : 2 workshops (2x2h)

Estimated personal work : 90 hours

US CREDIT HOURS / ECTS : 3 / 6

CONTENTS

- General architecture of aircraft structures
- Review of basic of Beam Theory
- Focus of Beam Theory on thin section walled section and hyperstatic condition
- Analysis of load transfer within joints through the use of the Beam Theory
- Emphasis on the thin walled structures
- Elements of Linear Fracture Mechanics and of Metallurgy in view of F&DT
- F&DT stakes and basic method for aircraft structures design

SS3 - French language and cultural discovery

OBJECTIVES	CONTENTS
<p>This course includes a welcoming module, French language classes and cultural workshops and visits in order to help students adapt the host country and make them familiar with their new environment.</p> <p>French classes based on levels :</p> <ul style="list-style-type: none">○ Classes will be set up to help students achieve an A1, A2, B1 or B2 level by the end of the semester, according to their level when arriving. <p>Cultural aspects :</p> <ul style="list-style-type: none">○ To learn about French culture and society○ To discover a new environment <p>Organization :</p> <ul style="list-style-type: none">○ Courses: 75h○ Workshops and visits: 15h○ Pupilage: 10h○ Personal work: 10h <p>Total: 110 hours</p> <p>Evaluation : Regularly tested in the French classes 1 final oral exam (30 min) 1 final written exam (1.5h)</p> <p>US CREDIT HOURS / ECTS : 3 / 6</p>	<p>French language:</p> <p>A1 level :</p> <ul style="list-style-type: none">○ Basic grammar, familiar expressions and vocabulary to use in a concrete context to satisfy immediate needs :<ul style="list-style-type: none">- Introducing oneself, introducing someone- Asking and answering questions- Topics related to personal relations and belongings (family, friends, accommodation...)○ Simple communication in everyday situations (asking in a polite way, doing some shopping, ordering in a restaurant...) <p>A2 level :</p> <ul style="list-style-type: none">○ Grammatical tools, expressions and vocabulary to understand and express simple messages○ Topics related to personal relations and belongings, immediate environment and shared domain of interest○ Interacting in simple and short conversations <p>Cultural matters :</p> <ul style="list-style-type: none">○ Workshops on French culture○ Cultural Visits (The city of Toulouse, Aéroscopia, Cité de l'espace, museums ...) <p>Course director: Emmanuel Bénard</p> <p>ISAE-SUPAERO contact: Dorothée Vilaine</p>

SS4 – Aerodynamics and Propulsion

OBJECTIVES

In this course standard results of incompressible potential flow are revisited, along with key aspects of compressible flows, with the view of applications to both aerodynamics and propulsion.

The aims of the module are the following:

- To review conservation laws;
- To review key results of potential flow theory, including application to thin airfoils;
- To design an airfoil for a given set of constraints;
- To review finite wing theory;
- To study basic properties of two-dimensional transonic and supersonic flow;
- To study principles of gas turbine combustion.

Pre-requisites:

- Fundamentals of continuum mechanics
- Basic thermodynamics (BEng Mech Eng, BSc Physics)
- Gas Dynamics for Aerodynamics and Propulsion
- Fundamentals of viscous flows

Organization

13x combined lectures-tutorials (40h)
3x labs (6h)

Total: 46 hours (excluding examinations, revision time, and personal work-project)

**Estimated personal work and airfoil project:
46 + 20 hours**

Evaluation

3 lab session reports (2x10%+20%)
1 project reporting (20%)
1 intermediate written exam (1h) (10%)
1 final written exam (3h) (30%)

US CREDIT HOURS / ECTS : 3 / 6

CONTENTS

- Potential flows and the Kutta-Jukowski theorem
- Theory of thin airfoils and application to airfoil design
- The lifting-line theory, and non-optimized wing
- Introduction to airfoil and wing design
- Oblique shock waves
- Expansion
- Transonic flows
- Linearized flows
- Ideal gas model
- Propulsion principles
- The Ideal and Non-ideal Turbohaft Cycle
- Thrust and Propulsive Efficiency. The Turbojet Cycle
- The Turbofan Cycle

SS5 – Preliminary Aircraft Design

OBJECTIVES

In this course key aspects of aircraft design will be presented, such as requirements, regulations, design process, aircraft loads, mass models, aerodynamic and propulsion models, aircraft stability. Interactions between disciplinary issues will also be explored.

The aims of the module are the following:

- To discover key engineering disciplines at play in preliminary aircraft design with emphasis on low fidelity models;
- To explore the potential trade-offs at preliminary design stage;
- To complete the preliminary design of a conventional aircraft and, to a limited extent, a less conventional aircraft (high aspect ratio, blended wing body...);
- To use an existing preliminary aircraft design process, with potentially limited software developments;
- To present the final work to peers (oral) and within a synthetic report;

Pre-requisites: none

Organization

10 x lectures (30h)

2 x industrial lectures (6h)

Total: 36 hours (excluding intermediate presentations, project work, review time, and personal work)

Estimated personal work : approx. 90 hours

Evaluation

1 project reporting (60%)

1 intermediate review on certification (10%)

1 industrial lectures reporting (10%)

1 final oral presentation (1h) (20%)

US CREDIT HOURS / ECTS : 3 / 6

CONTENTS

- Review of atmosphere properties
- Aircraft design requirements
- Aviation regulations and certification
- Aircraft loads, mass models
- Review of basic aircraft aerodynamics and stability, and propulsion models
- Preliminary design process
